

# The Girl

Marek leaned against the terminal console, watching the data buffer spin. Coval's encrypted query sat open in the corner of his HUD, asking the question everyone back on Orestes-7 wanted answered: \*What the hell happened to the luxury draft?\*

Marek didn't bother sugarcoating his reply. He knew how the station's censorship neural nets worked—they were automated, aggressive, and entirely indifferent to nuance. Anything he typed would be scrubbed, smoothed, and rewritten into sterile corporate PR before it ever hit Coval's receiver anyway. The algorithm would turn his bitter truth into an "unfortunate, unpreventable spatial anomaly," so Marek figured he might as well spell out the exact, ugly reality for the logs.

The voyage had started smoothly enough. The rusted old Ceres ore-carrier was lugging an extra payload: a state-of-the-art colonization module packed with hyper-wealthy kids, the pristine offspring of Sol system royalty. They were supposed to detach near Saturn. On paper, the module was the pinnacle of corporate engineering. In reality, a single micro-meteorite strike tore through it like wet tissue paper, reducing millions of credits of elite tech to drifting debris.

When the alarms shrieked, the Captain had ordered Marek to deploy the emergency pod barriers. The pod system was designed so every pair of VIPs had their own protective barrier, but the automated sequence instantly jammed—a typical feature of "state-of-the-art" corporate gear. Marek had to override the system and yank the manual levers one by one.

He hadn't told Coval \*which\* levers he pulled first.

In the chaotic blink of a second, Marek had looked at the classified passenger files on his screen. He'd known the girl was the most connected person on the vessel, an heiress from an ultra-classified dynasty. But that wasn't why his hands had moved where they did. He had stared at her photo—at how absurdly young, radiant, and unreal she looked compared to the grey, calcified station rats he'd known his whole life. She looked like an angel. A creature like that simply wasn't supposed to die in a cold, dark chunk of iron. So, he bypassed the queue and yanked the lever for her pod first, saving her and her golden-boy Navy boyfriend, while the rest of the jammed barriers failed.

Later, when it became clear the other manual locks were completely clogged, Marek caught the Captain looking at him. There was no reprimand in the old man's eyes—only a quiet, profound gratitude. They both knew the unwritten rule of the Sol system: if a low-born crew lets an elite heiress die while saving a couple of mid-tier station hands, the corporate inquiries don't end with a reprimand. They end with the whole crew being recycled.

Marek liked to tell himself he dragged that lever to save their skins. But in his quieter, darker moments, he knew the pathetic truth: he'd done it simply because she was pretty, and he thought a face like that deserved to keep breathing.

Now, the ship was a strange, polarized pressure cooker.

The boyfriend, the Golden Navy Prodigy, was a ghost. Devastated by the death of his academy friends, he barely left his quarters, brooding over his grief. But the girl—the Elite Heiress—was a force of nature. She didn't weep. She moved through the rusted, grease-stained corridors of the ore-carrier with a cold, terrifying energy.

She worked the crew like an instrument. Every roughneck and line-tech on board was suddenly walking taller, practically humming just to be in her orbit. When she spoke to them, her electric charisma lit up the dead air of the ship. Even the Captain—a man who usually treated corporate brass like an unpleasant stain on his deck—seemed subtly bent under her spell. She played the "divide and conquer" game effortlessly, keeping the crew energized and entirely devoted to her comfort and safety under the guise of high-spirits.

Marek kept his distance. At forty-six, with calcified lungs and a quarter-century of stamping diagnostic buttons behind him, he was too old, too tired, and far too bitter to join the fan club.

Initially, before the strike, he'd been quietly thrilled at the prospect of being near actual Sol royalty—people from a world he'd only ever seen on compressed vids. But after three or four days, the shine had worn completely off. His natural cynicism, compounded by twenty-five years of quiet hatred for the corporate machine, acted like a thick insulator. He caught himself realizing that he was probably the only person on the entire vessel treating these high-born survivors like actual human beings instead of gods—if only because he lacked the social energy to do otherwise.

And yet, despite himself, Marek wasn't totally immune.

He leaned back, tapping his cracked knuckles against his desk, remembering yesterday's shift. He'd done some minor, trivial pleasantries for her—passing along a cleared atmosphere report or fixing a squeaky duct hatch in her sector. She had turned, flashed a warm, blinding smile, and thanked him with lavish, public gratitude right in front of the deck crew.

Marek smirked bitterly to himself in the quiet of the comms nook. \*God damn it,\* he thought, shaking his head. \*It really worked.\*

Whenever Coval actually bothered to ping him, it was never just a status check—it was an invitation for Marek to unleash the entire backlog of grievances he'd been nursing since leaving Orestes-7. And right now, the list was long.

He started typing, laying out his usual roundabout rant on the sheer, rotten state of modern human labor. On the old asteroid, everything had been managed by sprawling automated networks. Here on the heavy ore-carrier, however, things were oddly manual. The corporate mandates required a twenty-five percent human crew, ostensibly to keep basic spacefaring competencies alive in the species. But looking at the kids around him, Marek couldn't help but feel the effort was a total farce.

They did the bare minimum. Sure, when mandatory periodic training rolled around, the younger crew members followed protocol to the exact millimeter. They were technically proficient, but completely dead behind the eyes. The moment an official task ended, any semblance of real focus vanished.

If they weren't ordered to perform a duty, they sank straight into idle, superficial nonsense. They spent their off-hours playing subtle mind games, trading shallow pleasantries, or popping corporate-issued mood pills and slip-vr tabs designed to satisfy every basic human desire without a shred of effort. They were competitive, sure—mostly over the heiress's attention—but none of them were \*serious\*. Ask them how the vessel's trajectories were actually calculated, or how the magnetic seals on the thruster housings functioned, and you'd get blank stares.

None of them cared.

Marek, on the other hand, had become obsessed.

He was the only person on the entire deck with a physical whiteboard mounted in his berth. At night, while the rest of the crew chased digital highs, Marek sat up sketching schematics from scratch, designing and redesigning the ship in his head over and over again. Initially, he had known nothing about deep-space heavy transports. But after months out here, he had dragged himself through every technical manual he could scrape together. He actually understood the underlying principles now: the radiation shielding, the sub-light engine cycles, the backup navigation loops.

Yet, when he tried to ask the crew about a specific component or a strange reading, they treated him like a ghost. There was zero respect for a forty-six-year-old station rat with a heart murmur and calcified lungs. To them, he was an awkward, low-born relic who lacked their pristine academy pedigree.

\*Fine,\* Marek thought bitterly. \*I don't have their background. But I am the only one who actually knows how this rust bucket stays alive.\*

The only person who seemed to notice was the Captain.

The old man had picked up on Marek's growing technical appetite and quietly assigned him to oversee the maintenance of the secondary redundancy equipment. On paper, it looked like a nod to Marek's extra effort—a small reward for taking initiative. But Marek wasn't stupid; he saw the political maneuver for what it was.

Assigning Marek to the redundant systems killed two birds with one stone for the Captain. It gave Marek a purpose without stepping on the toes of the younger crew, who were desperate to log hours on the primary, high-prestige systems to build their resumes. It also kept Marek's cynical, bitter face out of the main corridors, saving the kids from having to look at him while they styled their long hair and put on a show for the corporate survivors.

Still, the Captain was the only soul on board Marek could actually respect. Once in a while, they'd share a real, human conversation about technology or life back on the nickel-iron asteroids. The Captain had even asked about Coval once or twice. He was the only other person alive on this hull who possessed actual, genuine curiosity. Everyone else was completely consumed by their own shallow orbits.

Marek hated their attitude. It represented everything he despised about the system—comfortably lazy, effortlessly arrogant, and utterly blind to the reality of the void around them.

Then, Marek reached the part of his message that had been nagging at him for weeks: the ship itself.

\*And by the way,\* Marek typed, his fingers striking the keys a bit harder, \*about the structural damage.\*

Every few days, the hull would shudder. Low, sickening vibrations ran through the metal decks, shaking the dust out of the overhead vents. Ever since the collision that destroyed the colonization module, the ship felt wrong to Marek. He could feel it in his teeth—a deep, persistent groan that suggested the ship was slowly falling apart at the seams.

Yet, whenever he queried the internal diagnostics, the ship's neural core insisted everything was in perfect shape. The system logged the core hull as completely untouched, maintaining that the impact was isolated \*entirely\* to the detached colonization pod. The Captain repeated the exact same line: \*The heart of the ship is fine. Nothing to worry about.\*

Marek had even tried running his own independent, unauthorized scans to look for structural fatigue or hidden stress fractures. Every single attempt was shut down by pre-programmed system overrides, returning pristine, green status reports.

\*It's absurd,\* Marek concluded in his message to Coval, wrapping up his sour, standard rant. \*We got slammed by a high-velocity impact. It ripped an entire luxury pod to shreds, but somehow our own frame didn't suffer a single micro-fracture? I can literally feel the floor shaking under my bunk, Coval. It's pre-programmed bullshit, all of it. But hey, what do I know? I'm just the guy stamping diagnostic buttons.\*

Month after month bled together into a flat, gray haze, and the cosmos finally did what it always does to a man out here: it got under his skin. It crept into his bones, hit his soul, and quietly crushed him.

Marek found himself waking up in the middle of the dark night cycle, heart hammering against his ribs, staring at the cramped ceiling of his berth in a sudden, cold panic. \*What am I doing here?\* he'd whisper to the stillness. \*What the hell am I actually doing?\*

The initial spark of technical obsession that had kept him going started to burn out. He put aside his schematics and let his whiteboard gather dust. You can only study a ship's structural blueprints for so long before you hit a wall; eventually, you hit the limits of the manuals and just want to \*build\* something, to apply it, to be creative. Marek was a scientist at heart, but out here, trapped in a metallic routine, he was hitting the void. There was nothing real for him to work on.

He pulled back from everyone. He shifted his maintenance routines to the deadest hours of the cycle so he barely crossed paths with the rest of the crew. Even his brief, grounded chats with the Captain dried up. On their last interaction, the old man had looked at Marek's hollow, bloodshot eyes and told him to take a break—maybe go sit in the common mess, drink a bulb of synthetic brew, and spend a little time with the others. The Captain could tell Marek was coming undone.

The Captain wasn't wrong. Marek felt horrible. He was completely swallowed by the suffocating scale of deep space. And what infuriated him most was the kids. They were fine. They glided

through the corridors as easygoing and untroubled as ever. Marek hated them for it. \*I'm the only one who actually understands how this ship functions,\* he'd think bitterly, \*so why am I the one breaking down while they play games?\*

If there was one small, perverse joy in the current ship dynamic, it was that the crew was miserable for a different reason. The Elite Heiress was now spending almost all of her time holed up with her grieving, golden-boy Navy boyfriend. The rest of the crew, who had been hopelessly vying for her attention, were left out in the cold with virtually no window to earn her smiles.

Except for Marek.

It started as a subtle suspicion, but Marek had caught her looking at him. Stealing quiet glances across the deck. More than once, when their paths did cross, she made a point to initiate a brief, casual conversation with him.

For Marek, those tiny moments were an oxygen line in a vacuum. The suffocating weight of his restlessness lifted just a fraction whenever she spoke to him. He would take a single, trivial sentence she uttered and replay it in his head for the rest of the shift, picking apart every word, every pitch of her voice. He knew it was pathetic—a side effect of his self-imposed isolation—but he didn't care. It was the only feeling on the ship that felt alive.

And then, his restless mind found a new target.

It wasn't enough to just study anymore; he needed to \*act\*. He needed to prove he wasn't just a bitter, 46-year-old station rat stamping diagnostic buttons. His eyes began settling on Unit G7 during his routine maintenance rounds.

Inside Unit G7 sat a dedicated Quantum Chip—an advanced piece of hardware capable of calculations an order of magnitude faster than the ship's primary, clunky logistics systems. It was completely underutilized, sitting idle while the ship relied on outdated corporate algorithms.

A wild, ambitious idea took root in Marek's head: \*If I had that quantum chip on my desk, I could rewrite the ship's entire logistical framework. I could optimize thrust vectors, resource allocation, structural strain monitoring—everything.\*

The idea consumed him. If he could bypass the corporate junk, optimize the ship's systems on his own, and present a flawless, high-efficiency network, the dark, oppressive cloud over his head would shatter. They would have to look at him differently. He wouldn't be the expendable "Article 45" outcast anymore—he would be a respected, essential part of the crew. Even \*she\* would see what he was truly capable of.

Nobody else on board would ever dream of tweaking a core corporate system like that. They lacked the vision, the drive, and the quiet desperation.

Whenever Marek performed checks near Unit G7, he would linger. He'd stand in the hum of the cooling fans, staring at the module housing, running scenarios through his mind. He pictured the Captain's impressed nod, the quiet respect from the deck hands, the heiress looking at him with genuine admiration.

But Marek wasn't just a foolish dreamer. He was an engineer at heart, cynical and methodical. He knew dreaming wouldn't get the chip onto his desk.

So, sitting alone in his dim berth, Marek began to plan how to actually steal it.

Getting his hands on the module should have been impossible. Marek had already checked the ship's primary warehouse inventory: there were five spare quantum chips sitting right there on the storage racks. But the warehouse was the absolute domain of Adam, a quartermaster who guarded corporate inventory like a fanatic. Adam was the kind of bureaucrat who wouldn't hand over a single dry biscuit if you were literally dying of starvation without the proper authorization stamp.

Going to the Captain was equally out of the question. Friendly chats in the mess hall were one thing, but asking to pull a high-end quantum processor for "personal optimization experiments" was a complete non-starter. That wasn't how the corporate machine functioned. Every piece of high-value hardware was bound to an official pipeline, tracked by rigid protocols because the ship

itself was worth a small fortune. You couldn't just play around with critical infrastructure.

The only realistic option was Unit G7 itself during its scheduled maintenance window.

The maintenance calendar showed the cycle was exactly one month away. Marek spent that entire month agonizing over every detail, organizing the plan in his head, pacing his cabin in a feverish loop. Every single day felt like a boulder he had to drag uphill. He swung wildly between two extremes. One hour, he'd sit at his desk congratulating himself on the sheer brilliance of the logistical algorithms he was going to run, picturing the quiet respect of the crew. The next hour, a wave of cold panic would hit him, and he'd realize how utterly insane he was being.

If he got caught stealing hardware and hiding it in his private berth, he would be completely destroyed. Wiped out. Stripped of his berth and handed a lifetime corporate debt penalty.

\*But what do I actually have to lose?\* he argued with himself, staring at his trembling hands in the dark. He was forty-six years old, trapped in the deep void aboard a groaning, shaking ship that pretended on paper to be pristine, but deep down was disintegrating under his feet. He was an "Article 45" throwaway. If he didn't take this leap, he'd spend the rest of his miserable life stamping buttons and watching elite academy kids act like he didn't exist. He \*had\* to do this.

When the scheduled maintenance window finally arrived, Marek walked into the sub-deck compartment with his stomach twisted into a hard knot.

He didn't just pull the chip right away. Instead, his hyper-analytical, cautious nature took over. He unlatched the housing, disconnected the quantum module, and then instantly slammed it back in, locking it into place. Then he took it out again. And put it back.

He repeated the motion thirty, forty, fifty times. Out, in, lock, unlock. His fingers were clumsy at first, slick with cold sweat, but he forced himself to drill the physical action into pure muscle memory. Every time he reinstalled the chip, he watched the status indicator closely until the little orange light began to blink, confirming the module was online and the system was happy.

He convinced himself he had built the ultimate safety net. If the central diagnostics ever flagged a discrepancy, nobody else on board even knew how Unit G7 functioned. The Captain would naturally order \*him\* to go inspect it. Marek could run to the sub-deck, slot the chip back in within five seconds, hit the reset toggle, watch the orange light blink, and report it as a simple transient glitch. It was foolproof.

\*Why am I even stressing over this?\* Marek thought, a sudden, surreal rush of confidence washing over his nerves. \*It's a no-brainer.\*

He unclasped the quantum chip one last time, slipped the heavy, cool rectangle of casing into his deep maintenance jumpsuit pocket, and walked out of the bay.

With the quantum chip tucked safely behind his desk, a sudden, heady rush of power flooded Marek's veins. He felt monstrous, godlike, entirely superior to everyone on the ship—the deck hands, the golden Navy prodigy, the heiress, even the Captain.

He set to work immediately, syncing his personal AI assistant to the hidden hardware. Together, they pushed the chip into overdrive, processing billions of numerical combinations every single second. Marek felt the glorious, uninterrupted state of flow. He was mapping out a revolutionary core architecture: a master algorithm to optimize navigation, trade logistics, oxygen distribution, and deck resource management all at once.

He paced his tiny berth in an electric haze, seeing himself in the same light as the great minds of history. \*This is how Da Vinci felt,\* he told himself, grinning in the dim light. \*This is the spark of real genius.\* He was a phantom visionary, working in secret, quietly re-engineering the world around him while the rest of the ship slept. It was exhilarating. It was inspiring. For the first time in his life, he felt utterly alive.

\*This is what I was built for,\* he thought, repeating the mantra every night as he added new parameters to the code. \*This is why I hated my old life—I was never given a real chance to show what I could do.\*

He carried that high into the ship's corridors. He walked taller. He stopped slinking along the bulkheads. When he passed the heiress, he offered a polite nod, looking at her not as a worshipful outcast, but almost as an equal. When he looked at the Captain, a wave of quiet pity washed over him—\*You've spent your whole life running a rust bucket, old man, but I'm the one re-inventing how the sky works.\* Even the Captain noticed the sudden, strange spring in Marek's step.

Then, slowly, the high began to wear off, replaced by a grueling, mundane reality.

The code didn't just solve itself. Marek hit a wall of relentless, microscopic bugs. An optimization in thrust vectors would suddenly degrade the life-support cooling loops. Fixing the cooling loops threw off the payload weight distribution. The system had thousands upon thousands of variables that required endless, manual fine-tuning.

\*It's fine,\* Marek reasoned, gritting his teeth through the next two months. \*The greater the struggle, the greater the glory.\*

He forced himself to keep going, but the work turned into an exhausting drag. Over time, as he cross-referenced his hyper-optimized models against the ship's standard, out-of-date baseline, a sickening truth began to dawn on him: his code wasn't significantly better. It was ridiculously complex, brutally sensitive to minor tweaks, and offered maybe a fraction of a percent in actual operational gain. It was barely even equal to the simple, clunky software already running the vessel.

Worse, Marek realized he had spent the last six months trapped in a tiny, claustrophobic cubicle, punching numbers into a screen and waiting for output logs. Just like he had for twenty-five years back on Orestes-7.

The excitement curdled into deep, bitter resentment. \*Why is this so damn hard?\* he'd snarl at his monitor at two in the morning, his eyes burning with exhaustion. \*I am the genius here! Why do I have to suffer through these useless, endless logs? I'm too good for this! I shouldn't be sitting in a dark room tweaking decimal points!\*

Every morning was the same. He would wake up early, filled with a desperate, fleeting hope that the overnight simulation had achieved a breakthrough. Every morning, he was met with the same lukewarm performance report.

Until the morning there was no report at all.

Marek sat up in his bunk, squinting at a dead, blank terminal. Confused, he reached under his desk to check the status light on the stolen quantum module.

His heart stopped.

The night before, he had set a mug of lukewarm, synthetic tea on the edge of his workstation. Sometime during the sleep cycle, a minor hull shudder—one of those deep, persistent shakes he hated so much—had knocked the mug over. A dark, sticky stream of liquid had dripped off the laminate wood, directly into the unshielded, open casing of the hidden quantum chip.

The module was ruined. Burnt out. Dead. A sticky puddle of tea had fried a multi-million-credit piece of high-tier corporate hardware.

Marek stared at the fried circuit board, his mind going completely blank. The sheer, absurd stupidity of it hit him like a physical blow.

A violent wave of panic and rage exploded in his chest. He slammed his fists down onto the metal desk, again and again, screaming into the quiet of his berth. He beat his fists until his knuckles bled, sobbing out a string of bitter, breathless curses. \*How could I be so stupid?! God damn it, how could I be so stupid?!\* He hated the chip. He hated the algorithms. He hated the ship, the void, and his own pathetic, desperate ambition.

He threw himself onto his narrow bunk, trembling, staring at the ceiling for hours as he tried to claw back a thread of sanity.

\*Okay. Okay,\* he whispered to the dark, forcing his breathing to slow down. \*I can fix this. I just need to put it back. No... I need to swap it.\*

The warehouse. There were spare units in the warehouse. He would just sneak in, grab one of the five replacement chips, slot it into Unit G7, and burn the evidence of the fried module.

With shaking hands, Marek logged into the ship's inventory system using his elevated technician access to pull up the exact storage bin location for the spare quantum modules. He carefully typed in the serial numbers, double-checking the stock count.

He froze.

Six months ago, standing in the dim, unlit sub-deck corridor, he had misread the faded stencil on the serial plate. In the dark, his eye had mistaken a '1' for a '7'.

He hadn't been looking at the entry for quantum chips at all.

Marek stared at the glowing green text on his screen. The actual warehouse count for spare G7 Quantum Modules didn't say five.

It said \*\*0\*\*.

A cold, agonizing numbness spread from his chest down to his fingertips. There were no spares. There was no backup. Unit G7 was dark, the stolen chip was fried with synthetic tea, and the entire ship's automated diagnostic sweep was scheduled for next week.

The realization struck Marek like a bolt of lightning.

He collapsed onto his narrow bunk, completely crushed under the weight of his own monumental stupidity. His entire life, his grand dreams of being a secret genius, a visionary line-thinker—all of it shattered into pathetic, embarrassing dust.

"Stupid... disgraceful, worthless idiot," he whimpered into his thin pillow, unable to even stand up.

He knew the cold reality of corporate law. Even if he ran down to the sub-deck and slotted the fried, tea-soaked module back into Unit G7, it wouldn't save him. The moment the automated diagnostic sweep ran, the system would flag the dead chip. The Captain would order a full incident report, the ship's internal logs would be pulled, and the corporate security nets would trace the missing time straight back to Marek's maintenance window.

They would destroy him. A financial penalty so massive he'd spend the rest of his calcified, short life working in the open-air radiation pits of some outer-rim strip mine until his lungs finally gave out completely. The corporation never forgave a loss on high-tier hardware.

Moving like a corpse, Marek dragged himself down to the sub-deck, swiftly slotted the dead, burnt chip back into Unit G7, and slunk back to his cabin. It fixed nothing, but he couldn't bear the thought of the empty housing sitting there a second longer.

For three straight days, Marek barely left his bed. He lay in the dark, sobbing quietly, paralyzed by a heavy, suffocating dread. Every distant noise in the corridor sounded like corporate marshals coming to take him away. He was cooked. He was dead.

But as the third day dragged on, his bitter, restless mind—the mind of a man who had spent twenty-five years finding loopholes in diagnostic logs—started to turn over.

\*Think, Marek. Think.\*

When the automated sweep flagged the dead chip, an official investigation would trigger automatically. The only person on board with the authorization to handle, alter, or sign off on low-level system logs was the auxiliary maintenance verifier.

\*Which is me.\*

\*No, no, you idiot,\* he argued with himself, grabbing his hair in frustration. \*It's useless! The routine diagnostic is hardcoded into the ship's schedule! You can't just erase a core hardware failure during a normal cycle without the system flagging manual tampering! You're dreaming again!\*

He sat up, his bloodshot eyes staring into the dark.

\*Unless... unless it isn't a normal cycle.\*

If a system failure occurred during an **\*\*emergency forced maintenance event\*\*** caused by external hull stress, protocol was entirely different. During a crisis, automated logging took a back seat to manual crew reporting. It had happened during the micro-meteorite strike that tore apart the colonization pod—when the ship shuddered violently enough, emergency overrides engaged, and log entries became messy, chaotic, and heavily dependent on human verification.

\*But how do you force a hull crisis on a heavy ore-carrier?\* Marek thought, his stomach churning.

\*You can't. It's impossible. Stop daydreaming, you lunatic! You're already dead!\*

And then, a dusty schematic he had memorized months ago flashed in his head.

**\*\*Aggregate Engine #5.\*\***

It was an old, brutally powerful sub-thruster unit, almost never used on standard routes. In the ship's technical logs, Marek remembered a specific manufacturer warning: running Aggregate #5 above a certain power threshold induced violent, resonance harmonic vibrations throughout the entire mid-hull frame. It shook the ship so hard that standard operating procedures strictly forbade its use during normal transit.

\*I can't just walk up to the bridge and turn on Aggregate #5,\* Marek muttered, pacing his small room. \*I don't have bridge clearance. I'm dead. It's over.\*

He stopped. His pulse began to race, a cold, dark adrenaline cutting through his depression.

\*What about during a mandatory drill?\*

During live crew training exercises, access controls on secondary systems were temporarily relaxed for hands-on instruction. If he was stationed in close proximity to the thruster control bank during an exercise, and if the Captain issued a routine manifold order... Marek could "make a mistake."

He could pretend to fumble a manual bypass lever. He could pull the wrong alternator toggle. Aggregate #5 would surge, the ship would slam into a violent, terrifying structural shake, and in the resulting chaos, Unit G7's failure could be blamed entirely on the sudden power surge and physical vibration strain.

\*And then,\* Marek thought, a grim smile creeping onto his face, \*I step in as the maintenance guy.\*

He could legally go into the corrupted sub-deck logs and mark Unit G7 as "destroyed via catastrophic resonance spike during thruster malfunction."

To make sure the corporate nets couldn't dig beneath his manual entry, he had one final card to play: a specialized data-shredding utility software Coval had slipped him back on Orestes-7. It was an old, underground tool that didn't just delete files—it scrambled disk sectors at a physical level, making it look like a hardware write-error caused by power fluctuation rather than human manipulation.

Those pristine, academy-trained kids on board wouldn't even know a tool like that existed, let alone how to trace it.

Marek wiped his face with his trembling, sweaty hands, leaning against his whiteboard. It was insane. It was recklessly dangerous. But as he looked at his options, he realized it was the only path left that didn't end in a radiation pit.

The logic was bulletproof in his head. The physical setup for the drill was practically inviting him to pull it off.

During the mandatory shipwide exercises, the crew was rotated through emergency maneuvering stations. Marek wasn't usually assigned to the main Alternator Console—that was usually left to the younger hands—but the training protocols strictly encouraged crew members to take initiative and practice unfamiliar roles. If he walked up to the board with enough quiet confidence and simply claimed he wanted to log hours on the manual sequence, nobody would question it. They'd probably be glad to let the old station rat handle the boring, manual switches while they slacked off.

The plan hinged on a split second. During the power-routing phase of the drill, instead of cycling Alternator Sequence 1, 2, or 3 like normal, Marek would flip the toggle for **\*\*Alternator 5\*\***.

Nobody on the bridge crew knew about Aggregate #5's violent harmonic quirk—it was buried deep in an obscure technical bulletin that only an obsessive like Marek would ever read. It wouldn't tear the ship in half, but it would set off a vicious, bone-rattling vibration through the mid-hull decks. A violent, artificial "system malfunction."

In the immediate aftermath, the ship's automated alerts would flag forced emergency maintenance protocols across multiple sectors. Marek wouldn't even touch Unit G7 right away. He'd wait two or three agonizing days, letting the chaos settle so no one connected the dots. Then, he'd walk down to the sub-deck, load Coval's data-shredder to corrupt the log files into an unreadable mess of "power surge data," write off the burnt quantum chip as casualty damage from the vibration spike, and walk away clean.

Sure, the Captain might give him a tongue-lashing for a sloppy sequence toggle, but making a minor human error during a routine drill was light-years away from facing a corporate court-martial for grand theft and hardware destruction.

For days leading up to the drill, Marek rehearsed the exact motion in his sleep. \*Walk up. Take the station. Reach out. Flip Toggle 5. Panic. Apologize. Clear logs later.\*

On the day of the exercise, Marek didn't take any chances. Hours before the alarm was scheduled to sound, he hovered around the sub-deck corridor, lurking near the Alternator Console so he could step into position the very second the drill officially began.

When the alarm finally blared through the bulkheads, Marek turned the corner into the control bay, his heart hammering against his ribs, his hands clammy and cold.

He froze.

Standing right in front of the primary control bank, holding a digital clipboard, was \*\*Adam\*\*.

The quartermaster \*never\* stood duty at the manual Alternator Console during training exercises. Not once in six months. But there he was, stiff-backed and miserable, aggressively running a diagnostic check on the toggle switches. Worse, the Captain was standing just a few paces back near the hatchway, silently observing the crew as they trickled into the bay.

Marek's blood ran cold. The entire scheme shattered in an instant.

He couldn't just walk up and push Adam out of the way. The quartermaster already despised Marek, and insisting on taking \*that specific console\* right under the Captain's watchful eye would scream suspicion. It had to look natural, effortless, accidental—or it would fail entirely.

Desperation clutched at Marek's throat as the rest of the crew slowly filed into the cramped room, taking their places. The clock was ticking, the alarm was howling, and Marek stood pinned to the deck, paralyzed as his one escape hatch slammed shut before his eyes.

The girl walked into the control bay, surrounded by that effortless, blinding presence of hers. She had likely been invited by the Captain to observe the exercise, but the reason didn't matter—the effect was instantaneous.

Adam couldn't resist. The moment she crossed the threshold, the quartermaster abandoned the Alternator Console without a second thought, rushing over to hover in her orbit and offer his usual eager, sycophantic pleasantries.

Marek didn't hesitate for a single microsecond. Politeness demanded he acknowledge her presence, maybe offer a quiet word to build on those recent nods, but survival overruled courtesy. Ignoring her completely, he lunged across the deck and planted himself firmly in front of the unmanned Alternator Console, sliding into the harness before anyone could stop him.

Adam turned back, his face twisting in bitter annoyance at losing the station. For a second, it looked like the quartermaster was going to order Marek out of the chair, but under the watchful, graceful eyes of the heiress and the stern presence of the Captain, Adam choked it back. He reluctantly took whatever secondary position was left open.

Marek's breathing was shallow, his hands slick with sweat on the manual controls. It had been clumsy, and perhaps a bit desperate, but in the chaotic shuffle of a starting drill, it passed as a

natural run of events.

The exercise progressed, the blare of the simulated alarm filling the bay. Marek's internal nervousness spiked to a fever pitch. He knew the sequence by heart, counting down the seconds in his head.

The moment arrived.

Instead of cycling Alternators 1, 2, and 3 from the primary bank, Marek deliberately reached to the wrong side of the panel. He bypassed the standard toggles and slammed the manual lever for **\*\*Alternator 5\*\*** all the way forward.

For two agonizing seconds, nothing happened.

Then, a deep, unnatural screech echoed through the metal frame of the ship. A violent, bone-rattling vibration slammed through the deck plates, throwing several crew members off-balance. Loose tools rattled off the bulkheads, and the overhead lighting flickered wildly as Aggregate #5 surged out of phase, sending a sickening harmonic shockwave straight through the mid-hull.

Marek stood in the middle of the vibration, pretending to freeze in sheer, bewildered terror, his heart pounding against his ribs.

The Captain's reaction was terrifyingly swift. He didn't yell; he didn't panic. Without a moment's hesitation, the old man barked out precise, razor-sharp commands straight over the comms: **\*\*"Marek! Decouple Five! Increase Four to balance!"\*\***

Marek scrambled to execute the order, yanking the lever on Alternator 5 back by half and throttling up Four.

Instantly, the violent shuddering died down, melting back into the ship's usual low, ominous hum. Out of the corner of his eye, Marek saw the flashing amber status lights on the secondary diagnostic board: the system had flagged a cascade of forced emergency maintenance procedures across the sector, just as he had calculated.

What truly impressed Marek, despite himself, was the Captain's sheer composure. The old man didn't even reprimand him on the spot. Instead, he stepped in front of the heiress with a totally straight face, calmly dismissing the violent jolt as a minor, expected transient shock from an experimental sequence—acting completely confident to keep her untroubled.

Marek wiped a bead of cold sweat from his forehead, leaning against the console as his trembling pulse began to slow. It had been ugly, and he owed his opening entirely to the heiress's unexpected entrance, but the trap was sprung. The forced maintenance cycle was logged, and the door to clearing his name was finally unlocked.

What followed went smoothly. The Captain wasn't even particularly harsh with Marek; he just gave him a quiet, disappointed look and told him he should review the drill manual before touching the sequence toggles again. Since the hull shock hadn't caused any immediate structural alarms and the resulting emergency checks logged zero critical hull damage, the incident faded fast.

Marek played it smart. He didn't rush straight to Unit G7. He waited five, then seven excruciating days, keeping his head down and acting like a chastised technician.

When he finally slunk down to the sub-deck during a dead-shift, he moved with practiced precision. He deployed Coval's data-scrambler, wiping the local maintenance logs into a scrambled, unreadable mess of voltage spikes, and flagged the G7 Quantum Module as damaged by catastrophic vibration resonance. He took official diagnostic snapshots, logged the broken component, and formally submitted the incident report.

When he brought the report to the Captain, the old man simply nodded and instructed Adam to file the paperwork to write off the hardware. Naturally, the scrambled log sector triggered an automated low-level system audit, but Marek knew how the corporate networks operated. After a high-velocity meteor strike and a violent engine shudder, corrupt log sectors were completely believable. The Captain might have nursed a quiet, lingering suspicion in the back of his head, but without a shred

of proof, Marek was officially safe.

And yet, a new, insidious feeling began to creep into his chest—driven not by fear of getting caught, but by a strange, quiet guilt.

It wasn't about the hardware. The corporation had endless money, and nobody was going to get fined or court-martialed over a single fried chip. It was the Captain's face. Over the next few days, the old man looked increasingly troubled, carrying a heavy, deep strain that hadn't been there before the drill.

Then came the dreams.

For three nights in a row, Marek would wake up drenched in cold sweat. In the dream, the sudden surge from Alternator 5 didn't just shake the ship—it cracked the main hull wide open. He would watch in silent terror as the metal skin of the ore-carrier tore apart like wet paper, venting the decks, the Captain, the heiress, and himself out into the freezing, lifeless vacuum.

Every morning, Marek tried to shake it off, dismissing the nightmares as nothing more than a guilty conscience and bad nerves. But deep down, as the ship gave its usual low, ominous shudder, the feeling refused to leave him.

The violence of the crash didn't register as real at first.

When the initial shudder slammed Marek against the side of his bunk, he dismissed it. It was just the nightmare again—the same recurring nightmare of the hull tearing open that had plagued him for days. But then came the metallic, agonizing screech of twisting bulkheads, followed by the deep, terrifying groan of the entire frame snapping.

Then, the main station sirens howled.

Marek scrambled out of his berth in a cold, blind panic. Hands shaking violently, he dragged his environmental suit over his body and threw open the hatch. The corridor was a nightmare of dense, choking dust and thick grey smoke. Emergency floor strips flashed violently, guiding the way. Structural alarms screeched, and for the first time since he'd been aboard, the automated maintenance robots were swarming—skittering through the fog like metal spiders as the ship literally tried to sew itself back together.

Through the haze, Marek stumbled into three figures. It was the Golden Prodigy, the Elite Heiress, and Adam.

They were already in full suits, but the easygoing arrogance of the two elites was entirely gone. They looked terrified, desperate, and fiercely determined to survive. The girl leaned in, whispering frantically to her boyfriend, who turned toward Marek with wild, wide eyes.

"Marek! Fast!" the boy yelled over the roar of the alarms. "We're going to the G7 auxiliary life support unit! The Captain said the primary unit is failing—we have to manually kickstart the backup, or we're dead in minutes! You know the sub-deck layout!"

Marek opened his mouth, but no sound came out.

Instead of moving, Marek found his eyes locked onto the girl. Even in the dim, flashing red light, through the scratched visor of her suit, her expression struck him like a physical blow. Her eyes weren't just scared—they were calculated, sharp, and predatory. In that split second, the illusion shattered. She wasn't an angel. She was a survivor who would burn the whole world down just to keep breathing.

A sudden, paralyzing dread locked Marek's joints. He couldn't move. He couldn't step forward.

"He's frozen! We don't have time for this!" the boy panicked, pulling at her arm. "Leila, we have to go without him!"

Adam's grating voice boomed over the comms channel. \*"**Leave him! The old station rat is useless! A completely spineless prick! I know where G7 is, I'll take you!**"\*

Marek wanted to scream. He wanted to shout at the boy: \***Don't go with them! Look at her eyes! You're academy trained—you can fix it on your own! Don't take them near G7! You don't know**

what's waiting down there!\*

But his lungs refused to work. He stood frozen as the three of them vanished down the smoky corridor, their boots echoing into the dark.

The moment they disappeared, a primal, pathetic urge took over Marek's brain: \*Hide.\*

Let them handle it. Let the robots fix the ship. Let the high-born prodigy pull off a miracle. Marek knew the dark, forgotten corners of the ore-carrier better than anyone. He turned and ran, trembling, his calcified lungs burning as he dragged himself toward a tiny, auxiliary compartment that he knew possessed its own mechanical, self-sealing hatch.

He threw himself inside and slammed the seal.

A second later, the overhead lights flickered, died, and snapped back on in a sickly, pulsing \*\*pink\*\*.

Marek's stomach dropped. Pink lighting meant absolute system failure. The primary life support was dead. The ship was no longer a vessel—it was a drifting, freezing chunk of metal. They had minutes, maybe an hour, before the air turned to poison.

Sitting in the dark, shivering uncontrollably, Marek felt something hard in his suit's exterior pocket. He reached in, his gloved fingers squeezing the object.

He pulled it out. It was the fried, tea-soaked G7 Quantum Module. The dead chip he'd taken out of the system.

A horrifying realization cascaded through his mind.

The secondary life support system had two boot-up protocols. \*\*Sequence A\*\* was the automated, high-speed emergency sequence—it required an active quantum chip in Unit G7 to compute the rapid atmospheric balancing algorithms in seconds.

\*\*Sequence B\*\* was the manual, hard-coded fallback. It didn't need the quantum chip, but it required hours of manual, painstaking diagnostic checks and precise cable routing. In a dying, toxic ship, Sequence B was completely impossible. The boy would try to run Sequence A, hit the dead chip \*he\* had fried, and fail.

\*We're dead,\* Marek thought, staring at the useless rectangle of plastic and copper. \*I killed us all.\*

Then, something inside Marek broke. The fear simply... vanished.

A strange, eerie numbness washed over his mind. It felt as if he had detached from his own body, stepping back to watch himself like a character in a movie. He didn't feel panic. He didn't feel dread.

He stood up, unsealed the hatch, and walked out into the toxic haze.

He moved through the shuddering, ruined corridors like a phantom, stepping over fallen pipes and dodging arcing electrical wires. His hands moved on pure autopilot. He walked straight to the primary warehouse compartment—the one he'd been afraid to touch—forced the override hatch, reached into the primary diagnostic unit, and unlatched its primary operational quantum module.

He didn't care about corporate penalties. He didn't care about Adam. He didn't care about anything.

He squeezed the fresh, heavy module in his gloved fist and headed for sub-deck G7.

As he moved through the wrecked lower decks, he stumbled across a body lying in the dim smoke.

It was Adam. A falling conduit had clipped the quartermaster on his way down. His helmet visor was shattered wide open, his oxygen gauge reading dead zero, his lungs gasping uselessly in the vacuum-tainted air. The quartermaster clawed weakly at Marek's boot, his eyes wide with desperate terror.

Marek stopped, looking down at him through his own scratched visor, completely cold.

"Your cosmos ends here, lad," Marek muttered softly into his helmet mic.

He stepped over Adam's outstretched hand and moved forward.

As he descended further, the air inside Marek's own suit grew thick and foul. A sharp, chemical warning tone chimed in his ear, and his HUD flashed a blinding, violent **\*\*red\*\***. His suit seal was failing; toxic hull gas was mixing with his personal oxygen supply. His vision began to dim, fading into a noisy, blood-red blur until he could scarcely see a foot in front of his face.

He kept walking.

When he staggered into the G7 sub-deck compartment, the heiress was already collapsed near the main console, barely conscious, her energetic charisma reduced to shallow, wheezing gasps.

Only the Navy boy was still fighting, down on his knees in front of the open G7 terminal. But the boy was struggling—the console screen was corrupted, and the wiring bank was a chaotic mess.

"Marek?!" the boy gasped, turning his head as Marek entered. "You brought the module?! God, I need you! I can't see the manual bypass leads properly—my visor is fogging up and the color coding is totally washed out! Tell me the cable colors! *\*Please!\** I need you to tell me which colors go into the primary bus!"

Marek reached out, his own vision practically blacking out from the toxic mix in his suit. His gloved hand felt the heavy quantum chip, but his body was completely spent.

"Green..." Marek rasped, his voice echoing hollowly in his head. "Red... Orange... Blue..."

The boy took the fresh quantum module from Marek's trembling hands, slammed it into the slot, and frantically began matching the cables as Marek called them out.

Marek's legs finally gave out. He collapsed against the bulkhead, sitting frozen in the corner, too exhausted to move a single muscle, watching like a spectator as the boy took over entirely.

The Golden Prodigy slammed the master engagement toggle himself, igniting Sequence A.

A massive, thundering hum vibrated through the deck as the auxiliary atmospheric scrubbers roared to life. The sickly pink ambient lights flickered, died, and snapped back into a steady, bright **\*\*white\*\***. Fresh, cold air began to surge through the vents.

It was over.

Marek sat slumped in the corner of the room, listening to his own heavy, ragged breathing as the dread slowly returned to him.

Across the deck, the Elite Heiress slowly pushed herself up against the wall, breathing in the clean oxygen, her sharp, calculated eyes locking onto Marek. Marek looked at her, knowing that as long as she lived, her family's power would sweep the whole disaster under the rug to protect her reputation. She was their safety net.

But then Marek's eyes drifted toward the open hatchway.

There was still one man on this vessel he truly feared. The Captain.
